

SOLUTION REQUIREMENTS

Software Installation Request Automation in ServiceNow

PROJECT OVERVIEW

The project streamlines how employees request, approve, and fulfil software installations within an organisation. A standard ServiceNow Service Catalog item replaces email-based and manual communication with an automated workflow.

BUSINESS PROBLEM

Traditional software requests can be delayed by manual communication, unclear approval ownership, limited status visibility, and inconsistent fulfilment. These issues can also make software compliance and audit tracking difficult.

SOLUTION OBJECTIVE

Provide a central ServiceNow Service Catalog item that captures software installation requests and automatically manages approval, assignment, fulfilment, notifications, status tracking, and closure.

FUNCTIONAL REQUIREMENTS

1. Employees can submit software installation requests through the Service Catalog. 2. The request captures required details such as software name, justification, requester, device information, and urgency. 3. Requests are automatically routed to the appropriate approver. 4. Approved requests are assigned to the relevant IT support team. 5. IT staff can update fulfilment and resolution status. 6. Requesters can track progress and receive notifications. 7. Request and approval history is retained for audit purposes.

NON-FUNCTIONAL REQUIREMENTS

The solution should be secure, easy to use, auditable, scalable, maintainable, and reliable. Access must be controlled through ServiceNow roles and permissions, while workflow actions should be traceable.

EXPECTED OUTCOME

Faster processing, reduced manual coordination, better request visibility, consistent approvals, improved IT productivity, and stronger compliance and auditability.
